

SnapPitch Data Governance & Responsible AI Implementation

Real-world data governance, data quality and AI governance implementation for an AI-enabled CV platform

OLUWASOLA SOBOLA

Data Governance Team Lead | EPI-Tech Internship

PROJECT TYPE

Real internship project
Cross-functional digital product

FOCUS

Data Governance | Data Quality
Privacy | Responsible AI

PLATFORM

AI-powered CV generation
Registered-user architecture

1. Project context & governance trigger

Why governance requirements changed as the product architecture evolved

ORIGINAL DESIGN

Session-only architecture

User information was not intended to persist after use.

Governance scope was therefore comparatively limited.

ARCHITECTURE CHANGE

The platform evolved to registered users with persistent data storage, uploaded CV handling, profile reuse and returning-user dashboards.

This materially increased privacy, security, retention and accountability requirements.

GOVERNANCE RESPONSE

The Data Governance team updated the framework to address stored personal information, authentication, cloud storage, AI processing, lifecycle controls, monitoring and implementation oversight.

Governance was adapted to the changing product design rather than treated as a static documentation exercise.

2. My role & governance leadership

Leading the Data Governance workstream within a multi-team internship project

MY ROLE

Data Governance Team Lead

Led an eight-member governance team and coordinated governance deliverables, review activity and recommendations.

Worked with Software Engineering and wider project stakeholders as the platform architecture and requirements evolved.

CORE RESPONSIBILITIES

- Governance framework
- Data quality requirements
- Privacy & classification
- Retention & lifecycle
- Access governance
- Governance risk
- Responsible AI
- Review & assurance

WORKING MODEL

Governance defined requirements, reviewed the user-facing platform, documented findings and sought implementation assurance.

Technical teams remained responsible for engineering implementation of controls.

3. Governance deliverables

A practical governance foundation for the SnapPitch platform

Governance

Data Governance Framework
Governance responsibilities
Implementation requirements

Data Management

Data Inventory
Data Dictionary
Business Glossary

Data Quality

Data Quality Assessment
DQ dimensions & rules
Validation requirements

Privacy & Lifecycle

Data Classification Policy
Privacy Policy / Notice
Retention Schedule

AI & Risk

AI Governance Framework
Governance Risk Register
Incident escalation

Access & Assurance

Authentication/access
requirements
Admin & developer access policy
Monitoring/audit requirements

4. Data Quality: from principles to testing

How the team translated DQ concepts into platform controls and review evidence

DQ DIMENSIONS

Accuracy
Completeness
Consistency
Validity
Relevance
Timeliness
Integrity
Accessibility

DEFINED RULES

Valid email structure
Supported upload formats only
10 MB maximum file size
Mandatory fields completed
Authentication before uploads
Invalid/malicious payload
rejection

REVIEW FINDING → ACTION

Testing found some fields accepted values that did not match expected data types or formats.

Risk: inaccurate or unreliable data affecting profiles, reporting, analytics and downstream processing.

Recommendation: strengthen field-level validation, format/length rules and error messaging.

5. Governance review: findings & recommendations

End-to-end user journey review before final governance sign-off

PRIORITY	FINDING	RECOMMENDATION
HIGH	Privacy information not observed before personal data collection	Display Privacy Notice / Terms before or at registration
HIGH	Resume processing lacked transparency	Explain purpose, AI use, retention and deletion options
HIGH	Email verification not enforced during testing	Implement mandatory email ownership verification
MED	No cookie consent banner observed	Confirm cookie use and add consent where non-essential
HIGH	Weak validation in some input fields	Strengthen data type, format, mandatory and length validation
MED	Google authentication did not work as expected	Confirm release intent and resolve/test integration if active

Review approach: end-to-end user journey walkthrough, governance assessment, documented findings, recommendations and implementation assurance requests.

6. Architecture-to-governance mapping

Connecting platform components to governance risks and controls

PLATFORM / COMPONENT	GOVERNANCE RISK	GOVERNANCE RESPONSE
PostgreSQL / persistent profiles	Stored personal data	Classification, access, lifecycle, retention & deletion
Private S3 resume storage	CV / PII exposure	Restricted access, private storage, controlled file access
JWT + RBAC + bcrypt	Account & access risk	Authentication, authorisation, least-privilege expectations
OpenAI LLM processing	Privacy / AI transparency	Approved provider, processing transparency, governance oversight
CloudWatch / application logs	Sensitive log exposure	Restricted monitoring, audit visibility, limited retention

Important: the Governance team defined/reviewed controls and requested assurance; Engineering owned technical implementation.

7. Assurance, value delivered & lessons

What the project demonstrates about my practical Data Governance capability

ASSURANCE REQUESTED

Implementation evidence was requested for:

- Governance artefacts
- Encryption of uploaded resumes
- Role-Based Access Control
- Audit logging
- Retention schedule
- AI governance controls

VALUE DELIVERED

- Established a governance foundation
- Identified material governance gaps
- Connected DQ rules to platform validation
- Strengthened privacy & transparency recommendations
- Supported Responsible AI governance
- Created traceable recommendations for follow-up

LESSONS & CAPABILITY

- Governance must evolve with architecture
- Cross-functional collaboration is essential
- Documentation supports accountability
- Controls require implementation evidence
- Governance is continuous, not one-off
